

Partially Observable Games

AIMA Chapter 5.6

See also Osborne's "Introduction to Game Theory" Chapter 10

Information Sets

The information set is a union of all possible game states that we can be in (based on information available to us right now).

Information Sets

Player 1 picks a number from 1 to 4.

Player 2 guesses whether it is even or odd.

Right is guessing
even, and left is
guessing Odd

Player 2 cannot distinguish between these four states.

Information Sets

We can rule out certain states based on other players' behavior.

Information Sets

We can rule out certain states based on other players' behavior.

Information Sets

We can rule out certain states based on other players' behavior.

Information Sets

We can rule out certain states based on other players' behavior.

The Hat Game

Adversary puts red hats and blue hats on players' heads.

Players see other players' hats, but not their own.

At least one hat is red.

On their turn, a player says **red**, **blue** or pass.

If all players guess their hat color correctly, they win, otherwise they lose.

The Hat Game

Take a minute to think of how this game can be solved.

The Hat Game

The Hat Game

At least one hat is
red, and player 2's
is blue so...

The Hat Game

At least one hat is
red, and player 2's
is blue so...

I have no idea
what's happening

The Hat Game

The Hat Game

The Hat Game

The Hat Game

Red

Player 1 **knew**
they have a red
hat... so my hat
must be blue!

The Hat Game

Player 2's
information set:

"Red"

Player 2's knowledge about Player 1's knowledge

What happens if players announce their guesses simultaneously?

What happens if we have three players?

Beliefs and Information – a Formal Model

Zamir Maschler Solan's "Game Theory", Chapters 9 and 10

Player i 's belief space is some partition of the game states (more generally, a distribution over them).

Player i 's belief space is some partition of the game states (more generally, a distribution over them).

If two world states are in the same information set, they must have the same actions.

Player i 's belief space is some partition of the game states (more generally, a distribution over them).

If two world states are in the same information set, they must have the same actions.

Player i 's knowledge space is some partition of the game states (more generally, a distribution over them).

Players operate in some *world*. The set of possible worlds is called Y .

Player i 's information $\mathcal{F}_i$ is a partition of Y .

$$\mathcal{F}_1 = \{\{\text{yellow globe}, \text{green globe}\}, \{\text{blue globe}, \text{purple globe}, \text{red globe}\}\}$$

$$\mathcal{F}_2 = \{\{\text{blue globe}, \text{purple globe}\}, \{\text{green globe}, \text{yellow globe}, \text{red globe}\}\}$$

Given a possible world $\omega \in Y$, we let $F_i(\omega)$ be the information set containing ω in player i 's information $\mathcal{F}_i$.

$$\omega = \text{yellow globe icon}$$

$$\mathcal{F}_1 = \{ \{ \text{yellow globe icon}, \text{green globe icon} \}, \{ \text{blue globe icon}, \text{purple globe icon}, \text{red globe icon} \} \}$$

$$\mathcal{F}_2 = \{ \{ \text{blue globe icon}, \text{purple globe icon} \}, \{ \text{green globe icon}, \text{yellow globe icon}, \text{red globe icon} \} \}$$

An *event* is some subset of worlds $A \subseteq Y$. We say that a player i *knows* A under the world state $\omega \in Y$ if

$$F_i(\omega) \subseteq A.$$

$$\omega = \text{yellow globe icon}$$

$$\mathcal{F}_1 = \{ \{ \text{yellow globe}, \text{green globe} \}, \{ \text{blue globe}, \text{purple globe}, \text{red globe} \} \}$$

$$\mathcal{F}_2 = \{ \{ \text{blue globe}, \text{purple globe} \}, \{ \text{green globe}, \text{yellow globe}, \text{red globe} \} \}$$

An *event* is some subset of worlds $A \subseteq Y$. We say that a player i *knows* A under the world state $\omega \in Y$ if

$$F_i(\omega) \subseteq A.$$

$$\omega = \text{purple globe} \quad A = \{\text{purple globe}, \text{blue globe}\}$$

$$\mathcal{F}_1 = \{\{\text{yellow globe}, \text{green globe}\}, \{\text{blue globe}, \text{purple globe}, \text{red globe}\}\}$$

$$\mathcal{F}_2 = \{\{\text{blue globe}, \text{purple globe}\}, \{\text{green globe}, \text{yellow globe}, \text{red globe}\}\}$$

Who knows A ?

Given an event $A \subseteq Y$, we let

$$K_i(A) = \{\omega \in Y : F_i(\omega) \subseteq A\}$$

$K_i(A) \subseteq Y$ is the set of all possible worlds where player i knows A .

$$A = \{\text{purple globe}, \text{blue globe}\}$$

$$\mathcal{F}_1 = \{\{\text{yellow globe}, \text{green globe}\}, \{\text{blue globe}, \text{purple globe}, \text{red globe}\}\}$$

$$\mathcal{F}_2 = \{\{\text{blue globe}, \text{purple globe}\}, \{\text{green globe}, \text{yellow globe}, \text{red globe}\}\}$$

When do players know A ?

We can define $K_j(K_i(A))$ as $\{\omega \in Y: F_j(\omega) \subseteq K_i(A)\}$.
This is the set of all worlds where player j knows that player i knows A .

$$A = \{\text{purple globe}, \text{blue globe}\}$$

$$\mathcal{F}_1 = \{\{\text{yellow globe}, \text{green globe}\}, \{\text{blue globe}, \text{purple globe}, \text{red globe}\}\}$$

$$\mathcal{F}_2 = \{\{\text{blue globe}, \text{purple globe}\}, \{\text{green globe}, \text{yellow globe}, \text{red globe}\}\}$$

When does Player 2 know
that Player 1 knows A ?

$K_1 K_3 K_2(A)$ = when does player 1 knows that player 3 knows that player 2 knows A ?

$K_2 K_5 K_1 K_2(A)$ = when does player 2 knows that player 5 knows that player 1 knows that player 2 knows A ?

An event $A \subseteq Y$ is *common knowledge* in the world $\omega \in Y$ if for any finite list of players $(i_1, \dots, i_\ell)$,

$$\omega \in K_{i_1} K_{i_2} \dots K_{i_\ell}(A)$$

"Everyone knows A , everyone knows that everyone knows A , everyone knows that everyone knows that everyone knows A ..."

Adding priors: player i has a prior distribution over the possible worlds Y .

"given their behavior, it is unlikely that we are in a world where the opponent has a flush."

We say that player i knows the event $A \subseteq Y$ occurs in the world $\omega \in Y$ if they assign a probability of 1 to the event A given that we are in the world ω , i.e.

$$\Pr[A \mid F_i(\omega)] = 1 \Leftrightarrow F_i(\omega) \subseteq A$$

Common Prior:

$$\Pr[\text{Yellow Globe}] = \frac{1}{4}$$

$$\Pr[\text{Red Globe}] = \frac{1}{4}$$

$$\Pr[\text{Blue Globe}] = \frac{1}{3}$$

$$\Pr[\text{Green Globe}] = \frac{1}{6}$$

$$\omega = \text{yellow globe}$$

What are players' beliefs?

Common Prior:

$$\Pr[\text{yellow globe}] = \frac{1}{4}$$

$$\Pr[\text{red globe}] = \frac{1}{4}$$

$$\Pr[\text{blue globe}] = \frac{1}{3}$$

$$\Pr[\text{green globe}] = \frac{1}{6}$$

Common Prior:

$$\begin{aligned}\Pr[\text{Yellow}] &= \frac{1}{4} \\ \Pr[\text{Red}] &= \frac{1}{4} \\ \Pr[\text{Blue}] &= \frac{1}{3} \\ \Pr[\text{Green}] &= \frac{1}{6}\end{aligned}$$

$$\omega = \text{Yellow}$$

What are players' beliefs?

Player 1:

$$\begin{aligned}\Pr[\text{Red} \mid \text{Yellow Red}] &= \frac{\frac{1}{4}}{\frac{1}{4} + \frac{1}{4}} = \frac{1}{2} \\ \Pr[\text{Yellow} \mid \text{Yellow Red}] &= \frac{\frac{1}{4}}{\frac{1}{4} + \frac{1}{4}} = \frac{1}{2}\end{aligned}$$

Common Prior:

$$\begin{aligned}\Pr[\text{Yellow}] &= \frac{1}{4} \\ \Pr[\text{Red}] &= \frac{1}{4} \\ \Pr[\text{Blue}] &= \frac{1}{3} \\ \Pr[\text{Green}] &= \frac{1}{6}\end{aligned}$$

$$\omega = \text{Yellow}$$

What are players' beliefs?

Player 2:

$$\begin{aligned}\Pr[\text{Blue} \mid \text{Yellow Blue}] &= \frac{\frac{1}{3}}{\frac{1}{3} + \frac{1}{4}} = \frac{4}{7} \\ \Pr[\text{Yellow} \mid \text{Yellow Blue}] &= \frac{\frac{1}{4}}{\frac{1}{3} + \frac{1}{4}} = \frac{3}{7}\end{aligned}$$

Common Prior:

$$\begin{aligned}\Pr[\omega_1] &= \frac{1}{4} \\ \Pr[\omega_2] &= \frac{1}{4} \\ \Pr[\omega_3] &= \frac{1}{3} \\ \Pr[\omega_4] &= \frac{1}{6}\end{aligned}$$

1st Order Beliefs

	ω_1	ω_2	ω_3	ω_4
Player 1	$\frac{1}{2}\omega_1 + \frac{1}{2}\omega_2$	$\frac{1}{2}\omega_1 + \frac{1}{2}\omega_2$	$\frac{2}{3}\omega_3 + \frac{1}{3}\omega_4$	$\frac{2}{3}\omega_3 + \frac{1}{3}\omega_4$
Player 2	$\frac{3}{7}\omega_1 + \frac{4}{7}\omega_3$	$\frac{3}{5}\omega_2 + \frac{2}{5}\omega_4$	$\frac{3}{7}\omega_1 + \frac{4}{7}\omega_3$	$\frac{3}{5}\omega_2 + \frac{2}{5}\omega_4$

Common Prior:

$$\begin{aligned}\Pr[\omega_1] &= \frac{1}{4} \\ \Pr[\omega_2] &= \frac{1}{4} \\ \Pr[\omega_3] &= \frac{1}{3} \\ \Pr[\omega_4] &= \frac{1}{6}\end{aligned}$$

2nd Order Beliefs

If the world is ω_1 or ω_2 then player 1 believes that with prob. $\frac{1}{2}$, $\omega = \omega_1$ and Player 2's 1st order belief is $\frac{3}{7}\omega_1 + \frac{4}{7}\omega_3$.

With prob. $\frac{1}{2}$, $\omega = \omega_2$ and Player 2's 1st order belief is $\frac{3}{5}\omega_2 + \frac{2}{5}\omega_4$.
